Why it is so difficult to keep the farmers involved in participatory research?

It is a problem of temporality

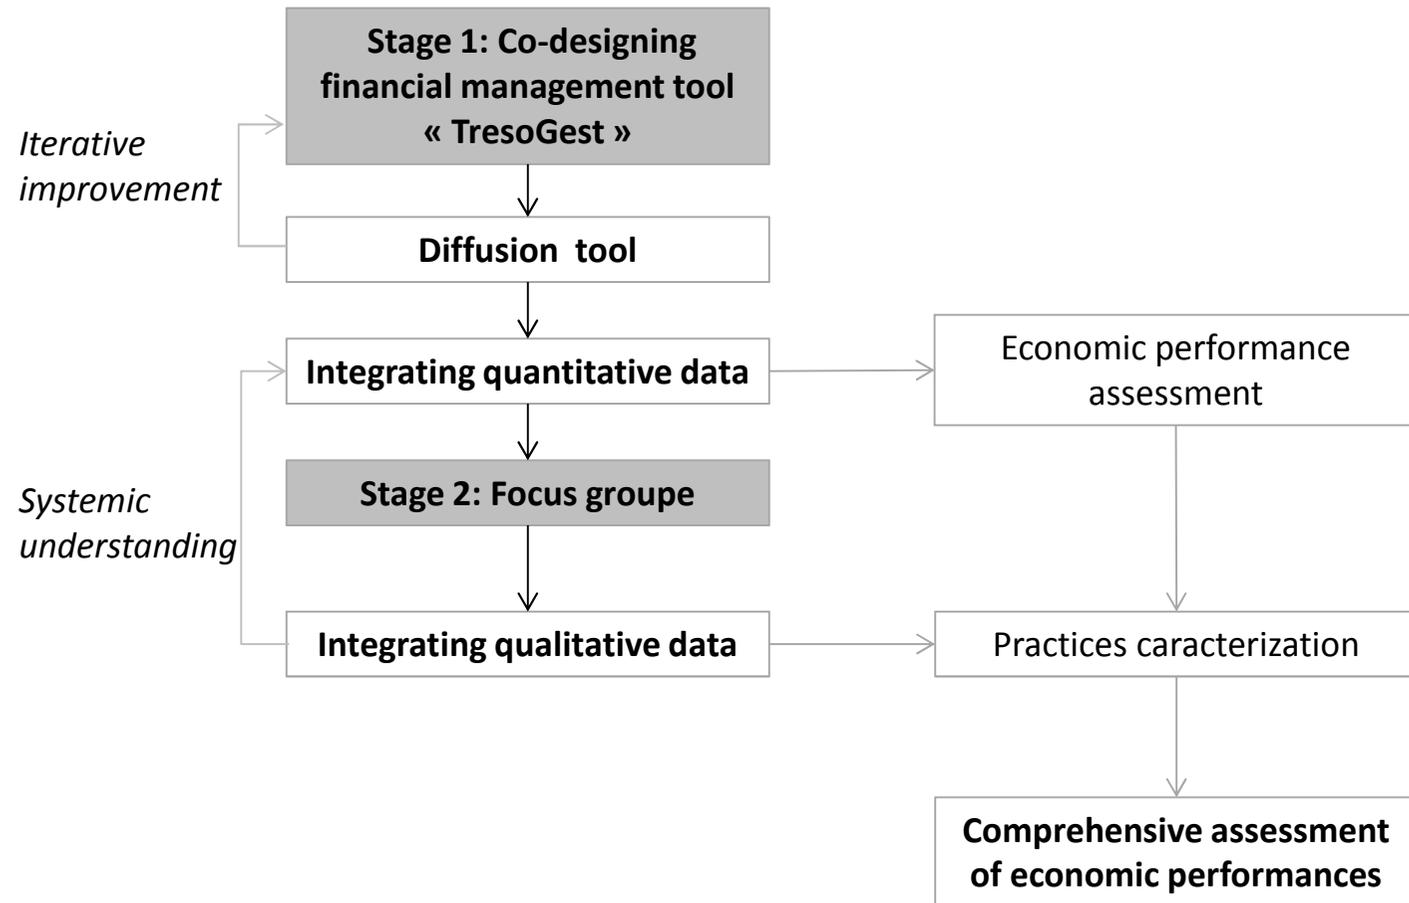

We set up a sustainable participatory process with organic cattle breeders

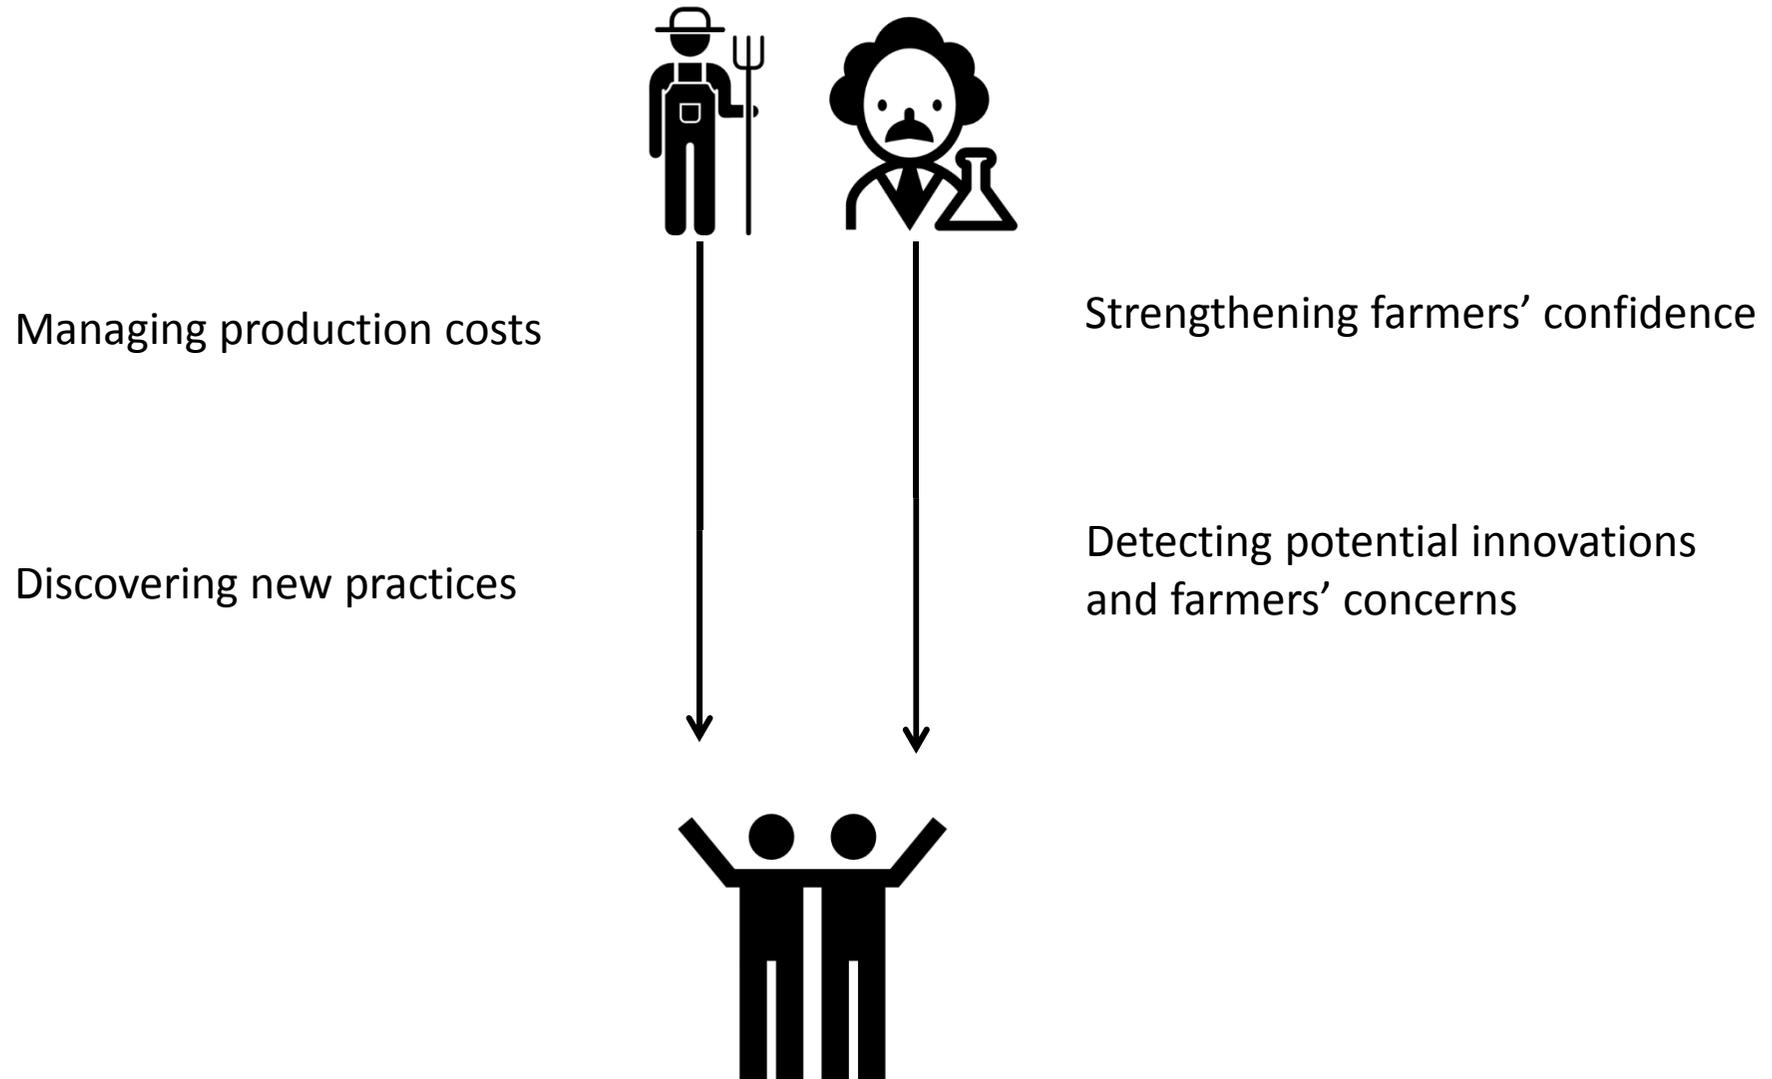

The final **goal** was to characterize **farmers' practices** and to assess their **economic performances**.

Our main **challenge** was to **maintain farmers' interest** throughout the research process.

# Co-designing a decision-support tool is the basis of our approach

To be sustainable, our research is designed as a win-win process providing concrete and immediate outcomes to farmers
